

## Problem Guideline for Code Samurai 2019

- Problem input will be given in csv format rather than shapefile. This ensures that you won't need to use any specialized tool or language.
- You will be asked to solve different types of real life routing problems.
- You need to output in two formats. These are:
  - **KML File:** This will be needed to show your output on a google map or openstreet map.
  - **Textual Description:** You will also need to generate a textual human readable description of the route.
- Your solution will be judged on several criteria. They will be revealed to you on the day of the hackathon. For now, you should know, the most important criteria will be efficiency of your program.

We hope you will have a great time solving the problems.
